# CRACKING IDM

**Name: Natnael Sisay  ID: CTC-1475-26**

Target: Internet Download Manager 6.43 build 15.2

- Windows 10

TESTED AND WORKING

21/10/26

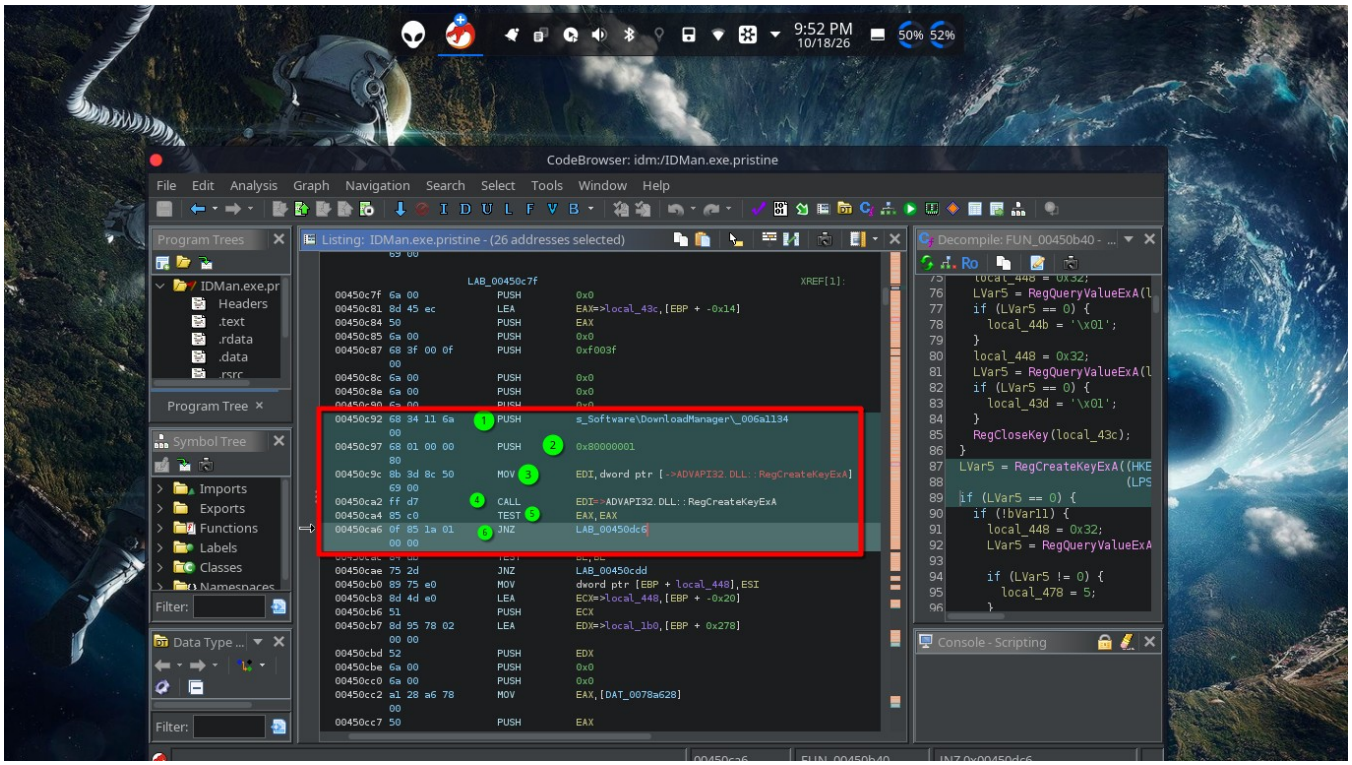

# The Idea

IDM does not store the licence inside the program file.It stores it in one registry key:

`HKCU\Software\DownloadManager`

On every start IDM reads a few values from that key and picks a state:

0 = registered and clean 1 = trial 2 = expired 3 = fake or blocked serial

# The One Rule That Matters

- IDM MUST BE CLOSED BEFORE YOU TOUCH THE REGISTRY.
- While IDM runs it keeps the licence state in memory it reads the registry, decides it is still Trial, and writes that back. So if you write the registration while IDM is running, IDM overwrites it You get no error idm just stays Trial.

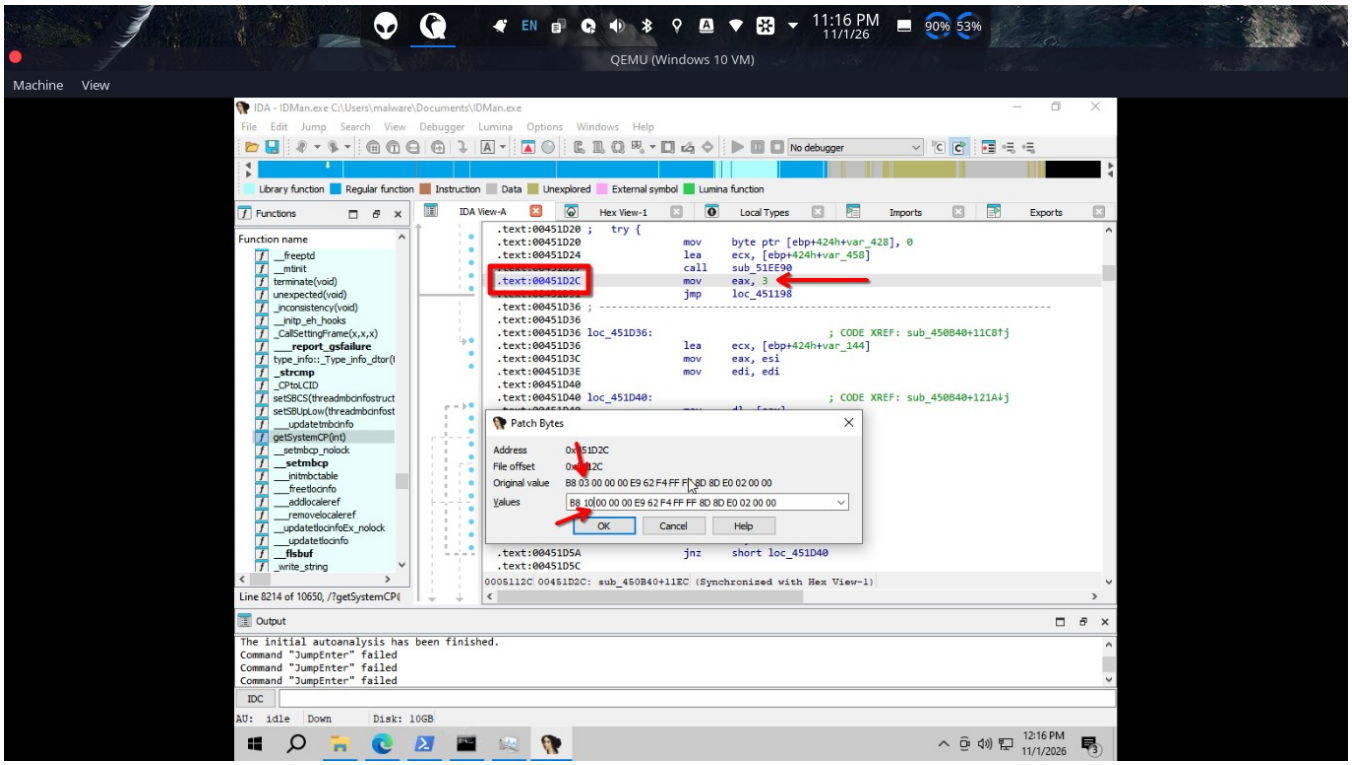

# patch 1: 0x451D2C

- Search the Strings view for registration- and license-related text.

- Follow references from relevant strings to the registration dialog and validation logic.

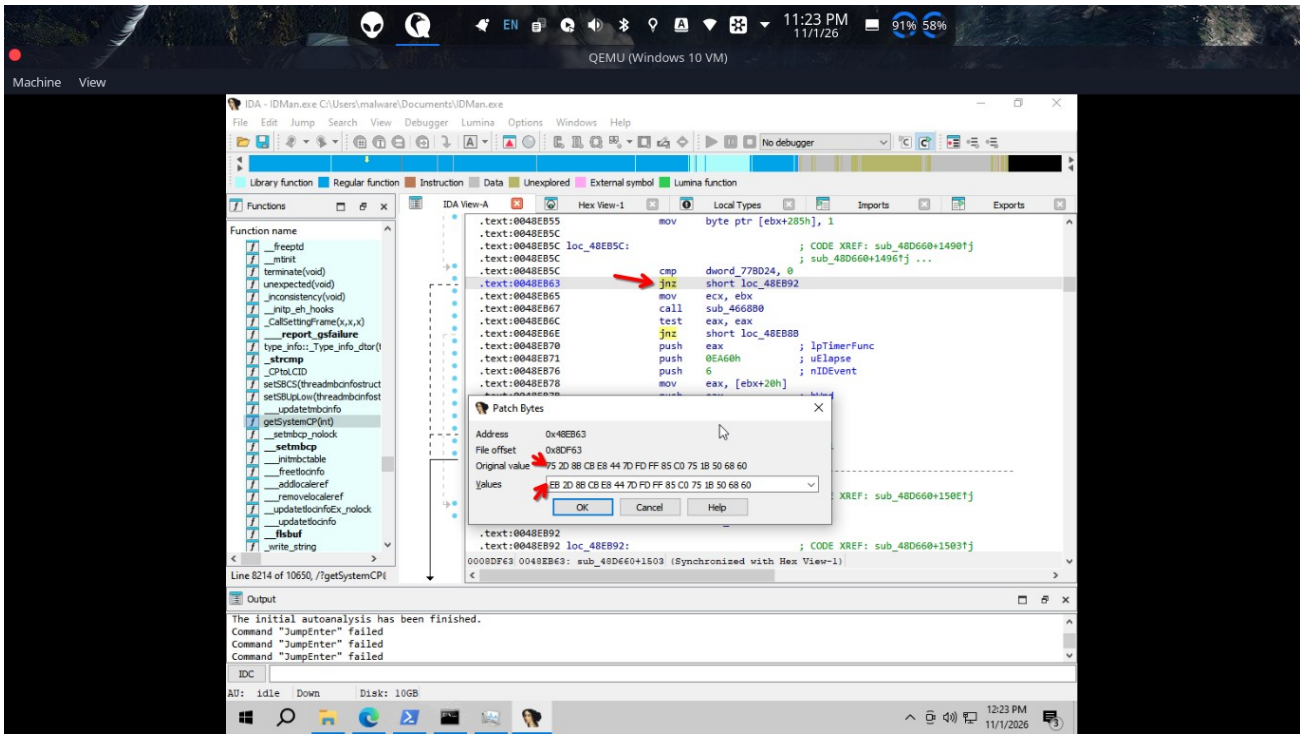

- I Found That The program keeps menu with 13 slots When it checks your license and it decides on a number, then opens the slot with that number. The code is
- cmp eax,0xc looks odd until you see the table: it holds 13 entries (0..12), each 4 bytes, at 0x4539CC:
  0 -> 0x4531c6 4 -> 0x4533bb 9 -> 0x45340d
  1 -> 0x4531dd 5 -> 0x45340d 10 -> 0x45340d
  2 -> 0x4532e0 6 -> 0x4533bb 11 -> 0x4531fc
  3 -> 0x453383 7 -> 0x45339f 12 -> 0x45341a
  8 -> 0x45340d

- 
- Some slots (5, 8, 9, 10) point straight at the end, where nothing is shown.
- 
- Slots 2, 4, 7, 10 and 12 each pointed somewhere else, and each of those places loads a different message: "incorrect Serial Number", "blocked on IDM servers", "trial expired", "different registrations".
- 
- 16 is the number that "everything is fine", and once I patched 3 to 16 .
- 
- I confirmed by the patch working and not directly written in the binary.

# patch 2:

- At startup, after the license check the program sets a reminder check again in 60 seconds
- The instruction is a conditional jump written in the exe as 75 jump if the test said "different"
- We change 75 to EB. EB is an unconditional jump always jump So the path that loads the timer is always skipped.
- The 60-second re-check never gets scheduled which means IDM stops re-examining the licence over and over while it runs.

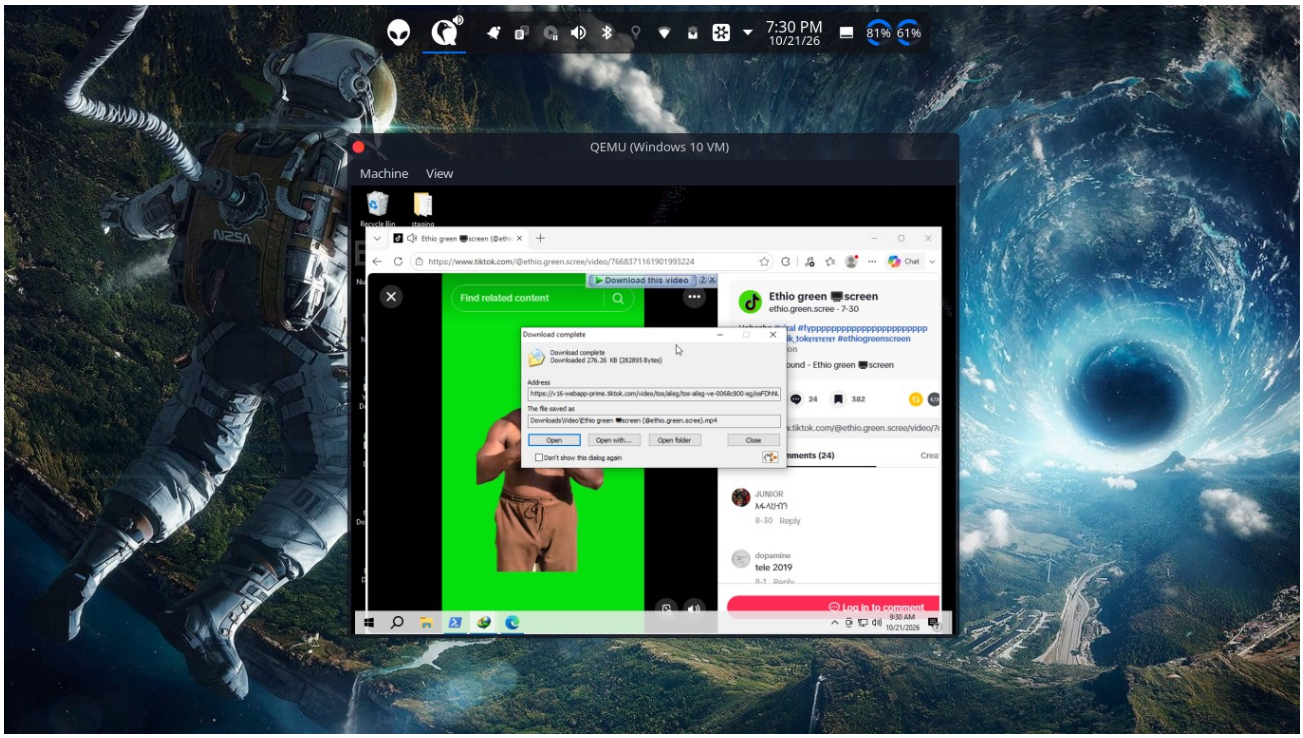

- **Save the patched idm**

➔ Run these to insert the registeration infos

➔ reg add "HKCU\Software\DownloadManager" /v FName /t REG_SZ /d "NATI" /f
reg add "HKCU\Software\DownloadManager" /v LName /t REG_SZ /d "PARROT" /f
reg add "HKCU\Software\DownloadManager" /v Email /t REG_SZ /d "4821.7390@tonec.com" /f
reg add "HKCU\Software\DownloadManager" /v Serial /t REG_SZ /d "L1KMV-492Z8-QHIWP-DEYG7" /f
reg add "HKCU\Software\DownloadManager" /v idmvers /t REG_SZ /d "v6.43b15 Full" /f
